

Introduction to Computer-Aided-Design

Introduction to CAD

Introduction to CAD

Why CAD?

- How to model real world objects? - Design
- How to put forth ideas in visual manner – Communication
- How to verify that design serves the purpose – Analysis
- How to get it made? – Manufacturing

All of the above can happen without Computers, but ...

Why CAD?

Better if assisted by Computers/Software

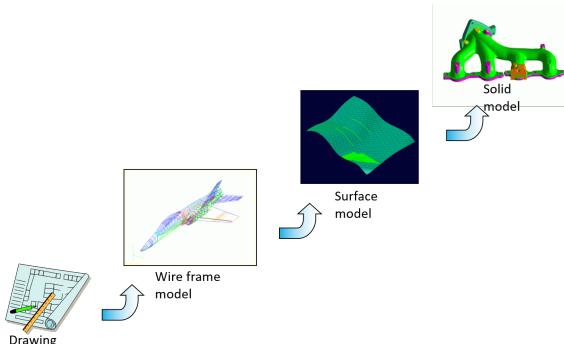

That's why : Computer Aided ... (CAx)

History

History

- The first source of CAD resulted from attempts to automate the drafting process.
- These developments were pioneered by the General Motors Research Laboratories in the early 1960s.
- CAD became more widely used after 1970 because of technological advancements.
- CAD allowed users to design products much quicker without the production of an actual product.

Evolution of CAD Technology

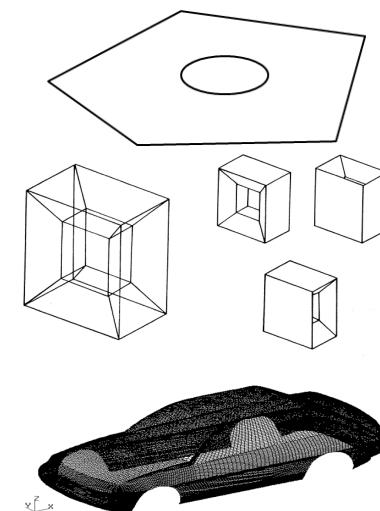

Manual drafting

- 2D representations used to represent 3D objects
 - multi-view drawings
 - pictorials
- Standards and conventions developed so that 3D object could be built from drawings
- Drawings created manually or using 2D CAD
- Difficult to visualize, error-prone, time-consuming

By dimensionality

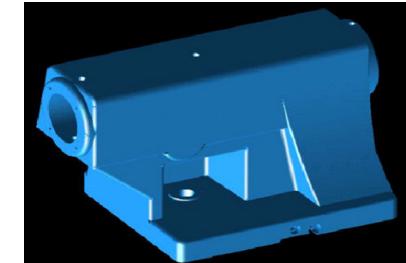

- 2D model: Point, line, circular arc, planar curve
- 3D model
 - Wire frame
 - Surface
 - Solid

Modeling Approaches

Modeling Approaches

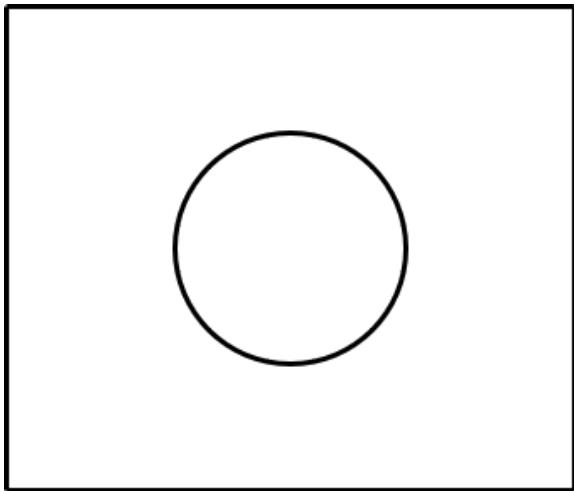

- By dimensionality: 2D/3D
- 2-Manifold vs Non-manifold
- Precision: Exact/Approximate
- What to store?
 - Procedure
 - Result
 - Hybrid

Advantages and Disadvantages of each?

2D CAD

- Simply replaces manual drawing
- Provides a set of drawing tools to create 2D elements, like, Lines, circles, arcs, etc.
- More accurate, easier changes to drawings
- Still no 3D representation of the object
- Example: AutoCAD

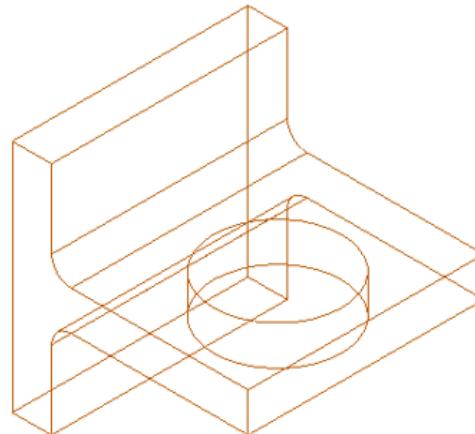

2D Applications

- Drafting – sketches, architectures, Drawings
- Art - Sketches, painting
- Electronic layouts, circuit design

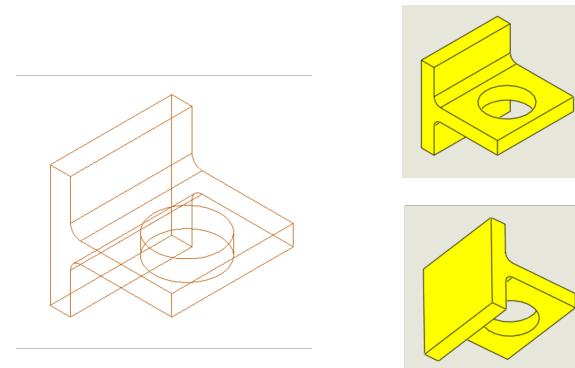

3D Wire frame Modeling

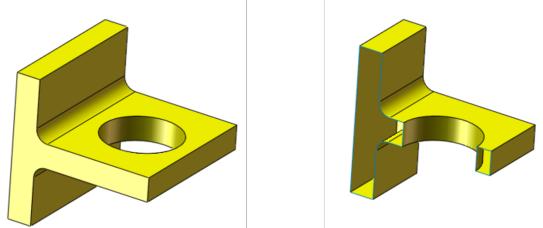

- Geometric entities are lines and curves in 3D
- Volume or surfaces of object not defined
- Easy to store and display
- Hard to interpret - ambiguous

Problems with wire frame models

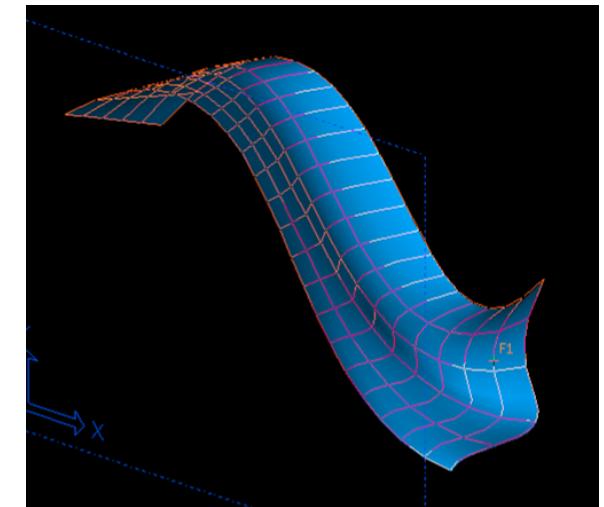

Surface Modeling

3D Surface Modeling

- Models 2D surfaces in 3D space
- All points on surface are defined, useful for machining, visualization, etc.
- Surfaces have no thickness, objects have no volume or solid properties
- Surfaces may be open

Surface Modeling

A Surface Model created using Alias Studio Tools

Surface Modeling

Surface Model created using Rhino

Why draw 3D Models?

- 3D models are easier to interpret.
- Less expensive than building a physical model.
- 3D models can be altered easily, create more concepts.
- 3D models can be used to perform engineering analysis, finite element analysis (stress, deflection, thermal....) and motion analysis.
- 3D models can be used directly in manufacturing, Computer Numerical Control (CNC).

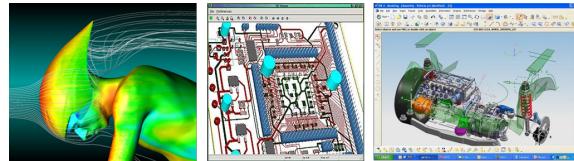

Solid, parametric, feature based modeling

- Complete and unambiguous
- Solid - models have volume, and mass properties
- Feature based - geometry built up by adding and subtracting features
- Parametric - geometry can be modified by changing dimensions

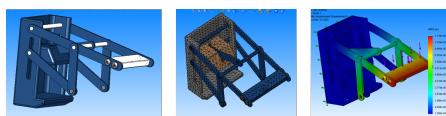

3D Applications

- CAD (Computer Aided Design)
- CAM (Computer Aided Manufacturing)
- CAE (Computer Aided Engineering) Finite Element Method
- CG (Computer Graphics)

Basics of Finite Element Analysis (FEA)

- A complex problem is divided into a smaller and simpler problems that can be solved by using the existing knowledge of mechanics of materials and mathematical tools
- Modern mechanical design involves complicated shapes, sometimes made of different materials that as a whole cannot be solved by existing mathematical tools. Engineers need the FEA to evaluate their designs

Computer Numerical Control (CNC)

A CNC machine is an NC machine with the added feature of an on-board computer.

Solids

What is a Solid?

- Define Solid?
- How would you represent Solid in software (data model)?

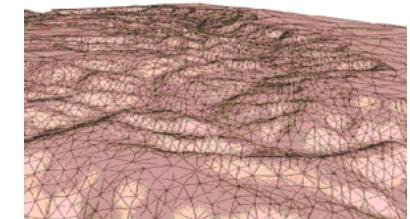

Cloud of points

- The simplest form
- Unorganized / organized points
- Too many points to represent the desired shape
- Hard to handle → further processing is required
- Obtained by digitizing
 - CMM (coordinate measuring machine)
 - Laser range scanner
 - ...

Mesh

- Most popular approximation model
- Graphics, RP, CAD/CAM, DMU, CAE
- Hard to handle
- Triangular mesh, Quad mesh, General polygonal mesh
- Create mesh by
 - triangulating cloud of points
 - facetting exact surface model
- Example: 123D Catch

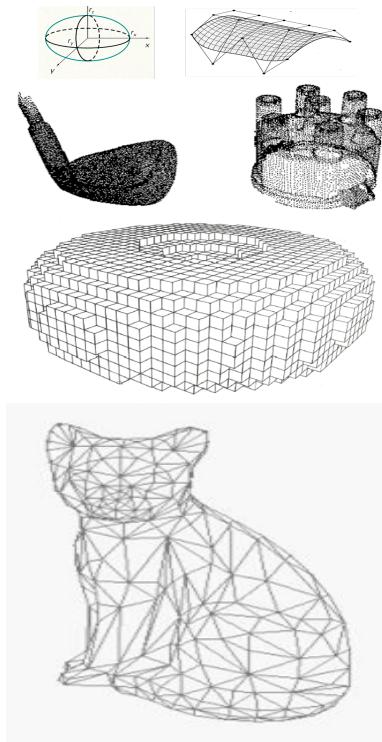

So, Classification By Precision

- Exact (?) model : Continuous/Smooth representation.
Explicit / implicit / parametric curves / surfaces

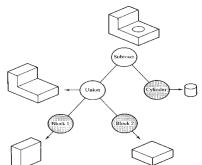

Approximate model

- Cloud of points
- Voxel
- Mesh

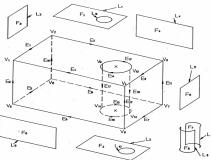

By Storage

- Procedural model : CSG (Constructive Solid Geometry)

- Result based model : B-Rep (Boundary representation)

B-Rep model

Topological element

- Vertex
- Edge
- Loop (Edge list)
- Face
- Lump
- Body

Geometrical element

- Point
- Curve
- Composite curve
- Surface, trimmed surface
- N/A
- N/A

Euler-Poincare formula

- For a polyhedron $V - E + F - 2 = 0$
 - V = Vertices
 - E = Edges
 - F = Faces
- Example: A tetrahedron has four vertices, four faces, and six edges $4 - 6 + 4 = 2$

Extension to Euler-Poincare formula

- A solid can have holes
- A face may have a loop or ring of vertices ‘floating’, i.e. unconnected by edges to the other vertices of the face

Extension to Euler-Poincare formula

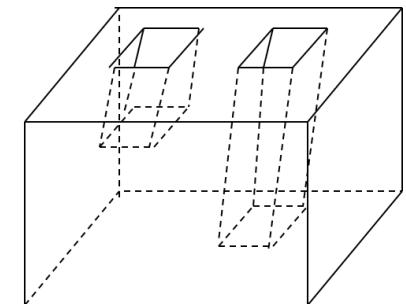

$$V - E + F - H = 2(C - G)$$

- V = Vertices
- E = Edges
- F = Faces
- H = Holes in faces
- C = Components (or shells)
- G = Genus (holes through solid)

“Tweaking” (deformations, twisting, and stretching but not tearing, or cutting) solids modifies the solid without changing the topology or the above numbers.

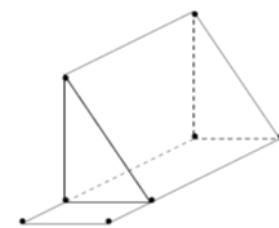

A solid with holes and loops

- $V - E + F - H = 2(C - G)$
- $24 - 36 + 15 - 3 = 2(1 - 1)$

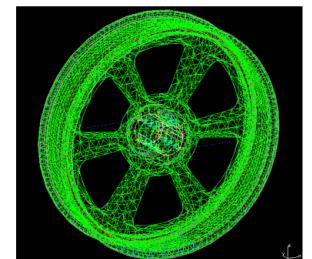

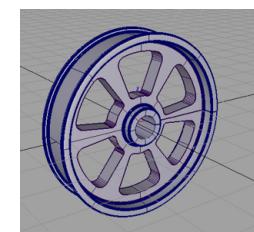

Limitations

- Necessary but not sufficient condition for a valid representation.
- Example: 8 vertices, 12 edges, 6 faces

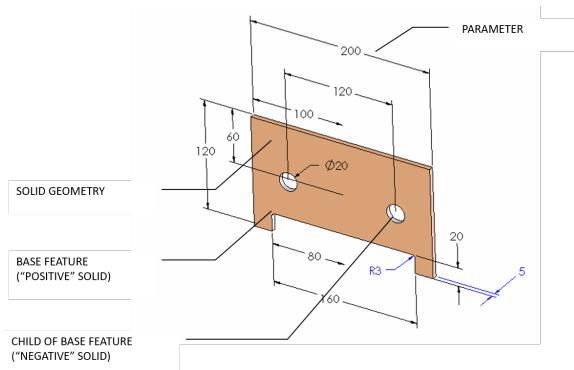

Brep vs Mesh

The object is represented by subdivision/discretization such as mesh and other geometric primitives.

Parametric, Feature-based Solid Model

Solid, parametric, feature-based Modeling Software

- High-end (more powerful)
 - NX (UGS)
 - Catia (Dassault Systèmes)
 - Pro/Engineer (Parametric Technologies Corp.)
- Mid-Range (easier to use)
 - Solid Edge (UGS)
 - Inventor (Autodesk)
 - SolidWorks (SolidWorks Corp.)

They all work basically the same way, *somewhat!*
